

POCKETSMART AI

Problem Statement

1. Background

Managing a limited budget can be difficult when users have multiple requirements and choices. Users need a simple system that can help them organize their available budget and generate suitable recommendations.

2. Existing Problem

Traditional planning methods require users to manually compare different options and calculate their available budget. This process can be time-consuming and may make it difficult for users to identify a suitable plan.

3. Main Problem Statement

Users often find it difficult to create a suitable plan according to their available budget, requirements, room type, preferred style, and selected items. Therefore, there is a need for an intelligent system that can understand user requirements and generate personalized recommendations.

4. Proposed Solution

PocketSmart AI is proposed as a Generative AI-powered web application that accepts user information such as budget, room type, style and required items. The application processes these inputs and generates a personalized plan using AI.

5. Project Objectives

The main objectives of PocketSmart AI are:

1. To provide a simple and user-friendly budget planning system.
2. To accept user requirements through a web interface.
3. To generate personalized recommendations using Generative AI.
4. To help users organize their available budget.
5. To provide room-based planning suggestions.
6. To reduce the effort required for manual planning.
7. To provide an interactive and easy-to-use web application.

6. Expected Outcome

The expected outcome is a web-based AI assistant that can accept user requirements and generate useful, personalized budget and recommendation plans.
